

NETFLOW MANAGER

Gain insight on capacity management, provisioning and forward capacity planning.

- ✓ DEPLOY NEW APPLICATIONS AND WAN SERVICE
- ✓ MANAGE PLANNED CHANGES AND UNEXPECTED EVENTS
- ✓ SOLVE PERFORMANCE PROBLEMS FASTER
- ✓ OPTIMIZE CONVERGED VOICE, VIDEO AND DATA NETWORKS

“THE BIGGEST THING IS THE ABILITY TO DO ASSESSMENTS IN A TIMELY MANNER AND REPORT BACK TO THE CLIENT ON THAT ASSESSMENT.”

- Wesley Robinson, President,
Hi Tech Solutions Integrators

Netflow Manager | Tracker exposes what other reporting tools can't show you, and demonstrates why you should never make business decisions based upon partial, summarized information.

Netflow Manager | Tracker provides detailed insights into network performance and usage. Netflow Manager | Tracker's in-depth visibility allows you to see information on all network conversations passing through the interfaces of supported routers and switches. This information can be provided to multiple business units on a per-user or per-group basis through customizable dashboard views.

In-depth application usage coupled with user profiling helps answer tough questions like:

- » Who are the users and what is the duration of the conversation?
- » What applications are they using?
- » Exactly what makes up my network traffic?
- » Who and what are consuming the bandwidth?
- » How is quality of service working?
- » Are network usage policies being followed?

FEATURES & BENEFITS

Ensure the delivery of critical business services to your organization

- » Leverage Cisco WAAS and understand the impact of application acceleration
- » Tighter integration for the IT team and improve management and operations views
- » Server resource metrics for troubleshooting and optimizing delivery of critical applications

Maintain business capabilities through individual productivity

- » Robust client analysis
- » Correlation of client performance with detailed application server metrics

Better utilization of IT resources to support users

- » Common services, configurations and application performance capabilities streamline end-user workflow
- » Complete visibility into servers and infrastructure to reduce mean time to repair

Netflow Manager | Reporter is a unified system that provides enterprise service intelligence to help organizations effectively deliver network, application and VoIP performance.

In order to effectively monitor and manage networks, there is a need to monitor traffic flows to and from all network segments. Any-to-any site connectivity introduces complexity requiring complete visibility of network performance between sites, and network managers must be able to ensure proper class of service

configuration, while validating network SLAs. Netflow Manager | Reporter collects data from multiple Netflow Manager |Tracker sources in order to provide a consolidated view for multi-tenant environments or multiple logically separated networks.

Site performance views provide correlated application performance and usage metrics on a single screen with just one click. The breadth of visibility and depth of analysis provided will arm your IT organization with actionable visibility to diagnose

networked application performance problems and isolate problem domain. Solve application issues and quickly isolate root cause by drilling down to a list of transactions, then creating the trace files to share internally or with outside vendors.

With integrated views and unique data correlation, Netflow Manager | Reporter enables effective management of your applications delivered across the enterprise or across managed networks.
